

HYDROTAC FOAM DRESSING

MAIN SPECIFICATIONS

- A foam dressing which is coated with a net-like hydrogel layer on the side facing towards the wound and a gas permeable, waterproof and bacteria-resistant outer layer made of polyurethane; the absorbent foam material quickly absorbs wound exudate without drying out the wound; in relatively dry wounds the hydrogel releases moisture and promotes the formation and maintenance of a moist wound environment, whereby the granulation and epithelisation are promoted; the wound dressing is soft and conformable, provides a good cushioning effect and can be removed almost painlessly; also available with an adhesive border.
- HydroTac comfort has an adhesive border all around, which is coated with hypoallergenic polyacrylate adhesive and holds the dressing securely in place.
- For the treatment of lightly to medium exuding wounds, during the granulation and epithelization phases, e.g. for leg ulcers, diabetic foot syndrome, decubital ulcer; for the treatment of burns up to degree 2a and skin graft donor sites after adequate bleeding control.
